

TITLE  
PC4 TRANSCRIPTIONAL COACTIVATORS

ABSTRACT OF THE DISCLOSURE

5                    This invention relates to an isolated nucleic acid fragment encoding a PC4  
transcription coactivator. The invention also relates to the construction of a chimeric  
gene encoding all or a portion of the PC4 transcription coactivator, in sense or  
10    antisense orientation, wherein expression of the chimeric gene results in production of  
altered levels of the PC4 transcription coactivator in a transformed host cell.
